

Instruction Set Nomenclature

Status Register (SREG)

SREG:	Status Register
C:	Carry Flag
Z:	Zero Flag
N:	Negative Flag
V:	Two's complement overflow indicator
S:	$N \oplus V$, For signed tests
H:	Half Carry Flag
T:	Transfer bit used by BLD and BST instructions
I:	Global Interrupt Enable/Disable Flag

Registers and Operands

Rd:	Destination (and source) register in the Register File
Rr:	Source register in the Register File
R:	Result after instruction is executed
K:	Constant data
k:	Constant address
b:	Bit in the Register File or I/O Register (3-bit)
s:	Bit in the Status Register (3-bit)
X,Y,Z:	Indirect Address Register (X=R27:R26, Y=R29:R28 and Z=R31:R30)
A:	I/O location address
q:	Displacement for direct addressing (6-bit)

8-bit AVR[®] Instruction Set

I/O Registers

RAMPX, RAMPY, RAMPZ

Registers concatenated with the X-, Y-, and Z-registers enabling indirect addressing of the whole data space on MCUs with more than 64K bytes data space, and constant data fetch on MCUs with more than 64K bytes program space.

RAMPD

Register concatenated with the Z-register enabling direct addressing of the whole data space on MCUs with more than 64K bytes data space.

EIND

Register concatenated with the Z-register enabling indirect jump and call to the whole program space on MCUs with more than 64K words (128K bytes) program space.

Stack

STACK: Stack for return address and pushed registers

SP: Stack Pointer to STACK

Flags

- ↔: Flag affected by instruction
- 0: Flag cleared by instruction
- 1: Flag set by instruction
- : Flag not affected by instruction

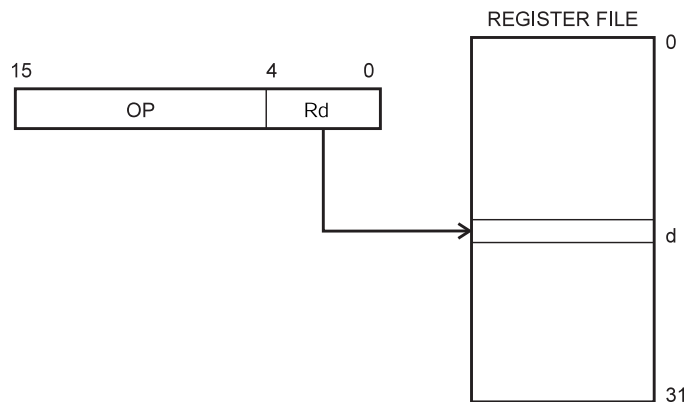

The Program and Data Addressing Modes

The AVR Enhanced RISC microcontroller supports powerful and efficient addressing modes for access to the Program memory (Flash) and Data memory (SRAM, Register file, I/O Memory, and Extended I/O Memory). This section describes the various addressing modes supported by the AVR architecture. In the following figures, OP means the operation code part of the instruction word. To simplify, not all figures show the exact location of the addressing bits. To generalize, the abstract terms RAMEND and FLASHEND have been used to represent the highest location in data and program space, respectively.

Note: Not all addressing modes are present in all devices. Refer to the device specific instruction summary.

Register Direct, Single Register Rd

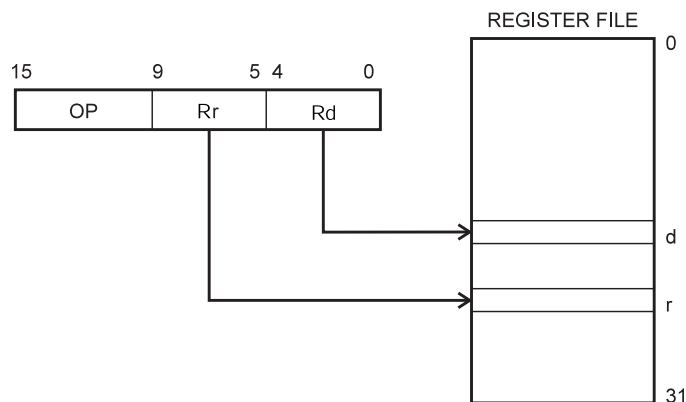

Figure 1. Direct Single Register Addressing

The operand is contained in register d (Rd).

Register Direct, Two Registers Rd and Rr

Figure 2. Direct Register Addressing, Two Registers

Operands are contained in register r (Rr) and d (Rd). The result is stored in register d (Rd).

I/O Direct

Figure 3. I/O Direct Addressing

Operand address is contained in 6 bits of the instruction word. n is the destination or source register address.

Note: Some complex AVR Microcontrollers have more peripheral units than can be supported within the 64 locations reserved in the opcode for I/O direct addressing. The extended I/O memory from address 64 to 255 can only be reached by data addressing, not I/O addressing.

Data Direct

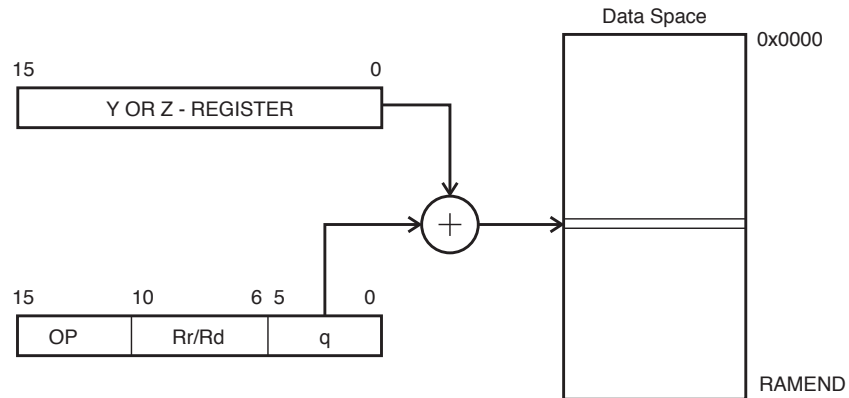

Figure 4. Direct Data Addressing

A 16-bit Data Address is contained in the 16 LSBs of a two-word instruction. Rd/Rr specify the destination or source register.

Data Indirect with Displacement

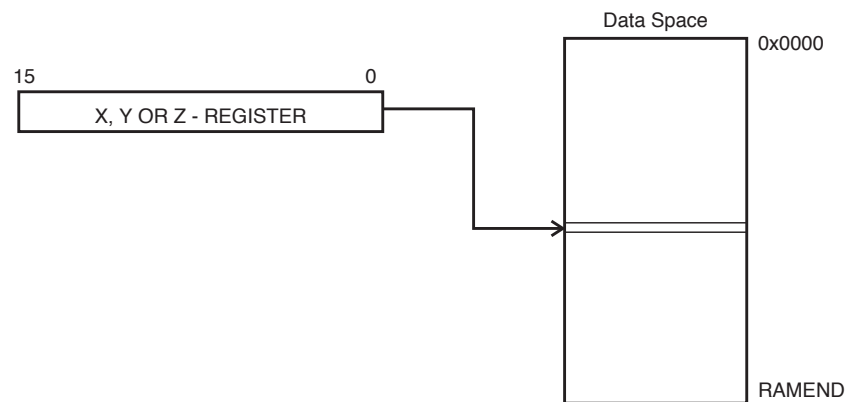

Figure 5. Data Indirect with Displacement

Operand address is the result of the Y- or Z-register contents added to the address contained in 6 bits of the instruction word. Rd/Rr specify the destination or source register.

Data Indirect

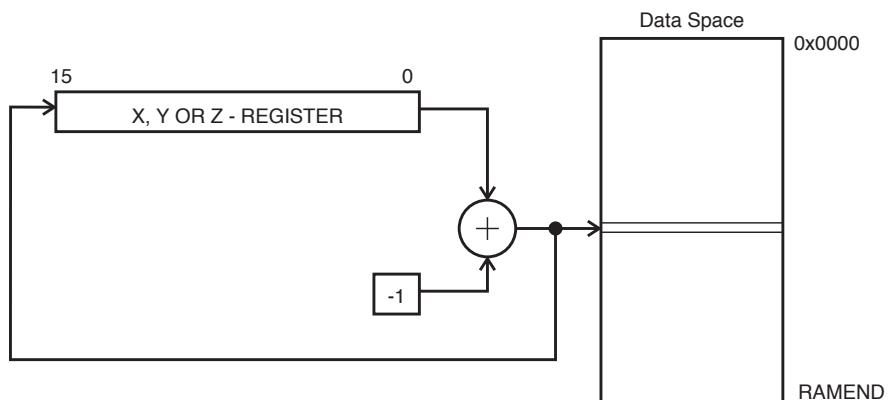

Figure 6. Data Indirect Addressing

Operand address is the contents of the X-, Y-, or the Z-register. In AVR devices without SRAM, Data Indirect Addressing is called Register Indirect Addressing. Register Indirect Addressing is a subset of Data Indirect Addressing since the data space from 0 to 31 is the Register File.

Data Indirect with Pre-decrement

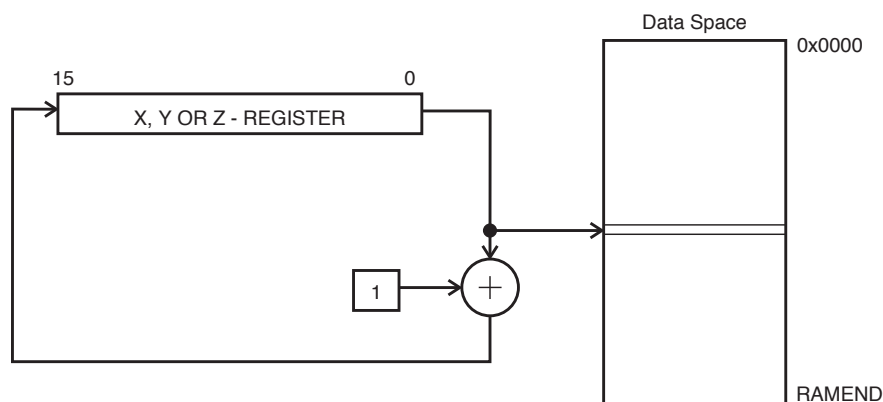

Figure 7. Data Indirect Addressing with Pre-decrement

The X-, Y-, or the Z-register is decremented before the operation. Operand address is the decremented contents of the X-, Y-, or the Z-register.

Data Indirect with Post-increment

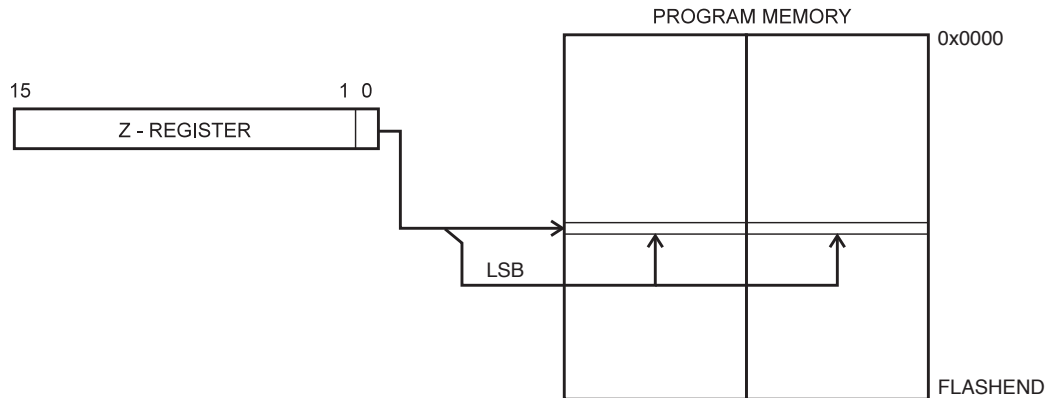

Figure 8. Data Indirect Addressing with Post-increment

The X-, Y-, or the Z-register is incremented after the operation. Operand address is the content of the X-, Y-, or the Z-register prior to incrementing.

Program Memory Constant Addressing using the LPM, ELPM, and SPM Instructions

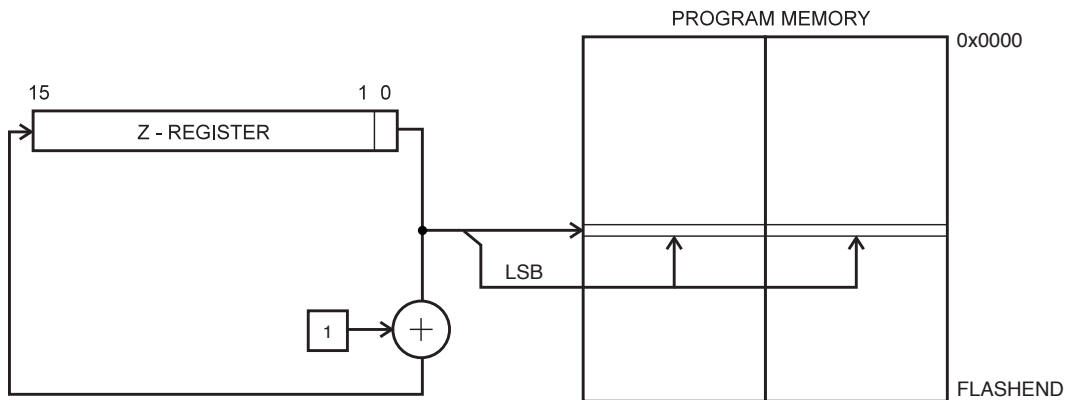

Figure 9. Program Memory Constant Addressing

Constant byte address is specified by the Z-register contents. The 15 MSBs select word address. For LPM, the LSB selects low byte if cleared (LSB = 0) or high byte if set (LSB = 1). For SPM, the LSB should be cleared. If ELPM is used, the RAMPZ Register is used to extend the Z-register.

Program Memory with Post-increment using the LPM Z+ and ELPM Z+ Instruction

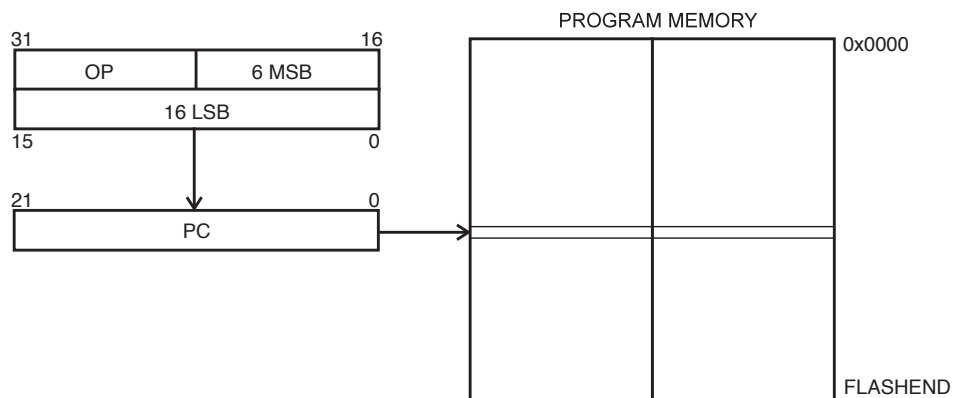

Figure 10. Program Memory Addressing with Post-increment

Constant byte address is specified by the Z-register contents. The 15 MSBs select word address. The LSB selects low byte if cleared (LSB = 0) or high byte if set (LSB = 1). If ELPM Z+ is used, the RAMPZ Register is used to extend the Z-register.

Direct Program Addressing, JMP and CALL

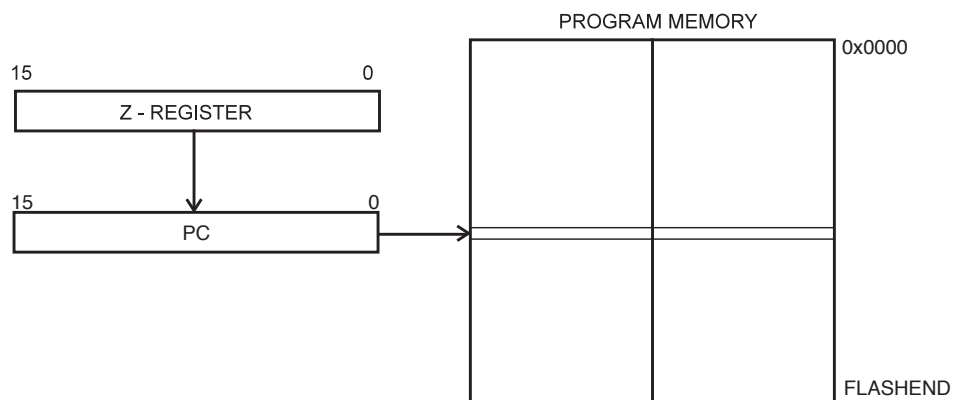

Figure 11. Direct Program Memory Addressing

Program execution continues at the address immediate in the instruction word.

Indirect Program Addressing, IJMP and ICALL

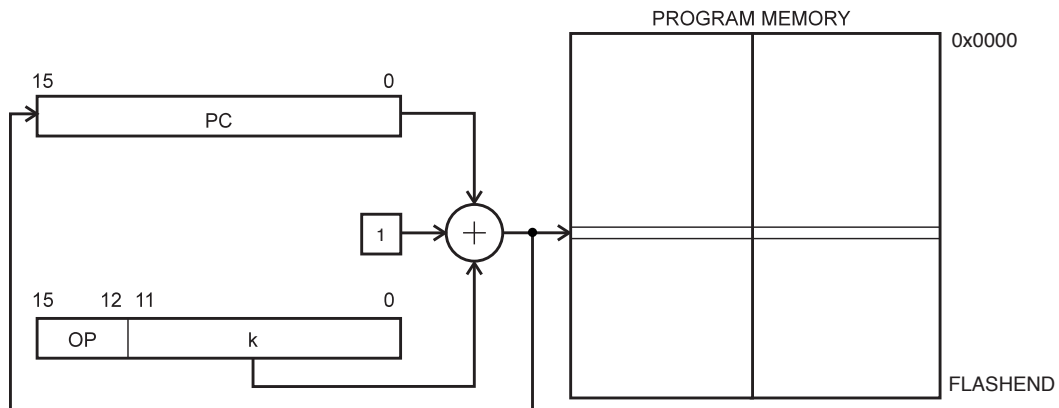

Figure 12. Indirect Program Memory Addressing

Program execution continues at address contained by the Z-register (i.e., the PC is loaded with the contents of the Z-register).

Relative Program Addressing, RJMP and RCALL

Figure 13. Relative Program Memory Addressing

Program execution continues at address $PC + k + 1$. The relative address k is from -2048 to 2047.

ADC – Add with Carry

Description:

Adds two registers and the contents of the C Flag and places the result in the destination register Rd.

Operation:

(i) $Rd \leftarrow Rd + Rr + C$

Syntax:

(i) ADC Rd,Rr

Operands:

$0 \leq d \leq 31, 0 \leq r \leq 31$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

0001	11rd	dddd	rrrr
------	------	------	------

Status Register (SREG) Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow

H: $Rd3 \bullet Rr3 + Rr3 \bullet \overline{R3} + \overline{R3} \bullet Rd3$
Set if there was a carry from bit 3; cleared otherwise

S: $N \oplus V$, For signed tests.

V: $Rd7 \bullet Rr7 \bullet \overline{R7} + \overline{Rd7} \bullet \overline{Rr7} \bullet R7$
Set if two's complement overflow resulted from the operation; cleared otherwise.

N: R7
Set if MSB of the result is set; cleared otherwise.

Z: $\overline{R7} \bullet \overline{R6} \bullet \overline{R5} \bullet \overline{R4} \bullet \overline{R3} \bullet \overline{R2} \bullet \overline{R1} \bullet \overline{R0}$
Set if the result is \$00; cleared otherwise.

C: $Rd7 \bullet Rr7 + Rr7 \bullet \overline{R7} + \overline{R7} \bullet Rd7$
Set if there was carry from the MSB of the result; cleared otherwise.

R (Result) equals Rd after the operation.

Example:

```

; Add R1:R0 to R3:R2
add r2,r0 ; Add low byte
adc r3,r1 ; Add with carry high byte

```

Words: 1 (2 bytes)

Cycles: 1

ADD – Add without Carry

Description:

Adds two registers without the C Flag and places the result in the destination register Rd.

Operation:

(i) $Rd \leftarrow Rd + Rr$

Syntax:

(i) ADD Rd,Rr

Operands:

$0 \leq d \leq 31, 0 \leq r \leq 31$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

0000	11rd	dddd	rrrr
------	------	------	------

Status Register (SREG) and Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	\leftrightarrow	\leftrightarrow	\leftrightarrow	\leftrightarrow	\leftrightarrow	\leftrightarrow

H: $Rd3 \bullet Rr3 + Rr3 \bullet \overline{R3} + \overline{R3} \bullet Rd3$
Set if there was a carry from bit 3; cleared otherwise

S: $N \oplus V$, For signed tests.

V: $Rd7 \bullet Rr7 \bullet \overline{R7} + \overline{Rd7} \bullet \overline{Rr7} \bullet R7$
Set if two's complement overflow resulted from the operation; cleared otherwise.

N: R7
Set if MSB of the result is set; cleared otherwise.

Z: $\overline{R7} \bullet \overline{R6} \bullet \overline{R5} \bullet \overline{R4} \bullet \overline{R3} \bullet \overline{R2} \bullet \overline{R1} \bullet \overline{R0}$
Set if the result is \$00; cleared otherwise.

C: $Rd7 \bullet Rr7 + Rr7 \bullet \overline{R7} + \overline{R7} \bullet Rd7$
Set if there was carry from the MSB of the result; cleared otherwise.

R (Result) equals Rd after the operation.

Example:

```
add r1,r2 ; Add r2 to r1 (r1=r1+r2)
add r28,r28 ; Add r28 to itself (r28=r28+r28)
```

ADIW – Add Immediate to Word

Description:

Adds an immediate value (0 - 63) to a register pair and places the result in the register pair. This instruction operates on the upper four register pairs, and is well suited for operations on the pointer registers.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:

(i) $Rd+1:Rd \leftarrow Rd+1:Rd + K$

Syntax:

(i) ADIW Rd+1:Rd,K $d \in \{24,26,28,30\}, 0 \leq K \leq 63$

Operands:

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

1001	0110	KKdd	KKKK
------	------	------	------

Status Register (SREG) and Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	–	↔	↔	↔	↔	↔

S: $N \oplus V$, For signed tests.

V: $\overline{Rdh7} \bullet R15$
Set if two's complement overflow resulted from the operation; cleared otherwise.

N: R15
Set if MSB of the result is set; cleared otherwise.

Z: $\overline{R15} \bullet \overline{R14} \bullet \overline{R13} \bullet \overline{R12} \bullet \overline{R11} \bullet \overline{R10} \bullet \overline{R9} \bullet \overline{R8} \bullet \overline{R7} \bullet \overline{R6} \bullet \overline{R5} \bullet \overline{R4} \bullet \overline{R3} \bullet \overline{R2} \bullet \overline{R1} \bullet \overline{R0}$
Set if the result is \$0000; cleared otherwise.

C: $\overline{R15} \bullet Rdh7$
Set if there was carry from the MSB of the result; cleared otherwise.

R (Result) equals Rdh:Rdl after the operation ($Rdh7-Rdh0 = R15-R8, Rdl7-Rdl0=R7-R0$).

Example:

```
adiw r25:24,1 ; Add 1 to r25:r24
adiw ZH:ZL,63 ; Add 63 to the Z-pointer(r31:r30)
```

AND – Logical AND

Description:

Performs the logical AND between the contents of register Rd and register Rr and places the result in the destination register Rd.

Operation:

(i) $Rd \leftarrow Rd \bullet Rr$

Syntax:

(i) AND Rd,Rr

Operands:

$0 \leq d \leq 31, 0 \leq r \leq 31$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

0010	00rd	dddd	rrrr
------	------	------	------

Status Register (SREG) and Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	–	\Leftrightarrow	0	\Leftrightarrow	\Leftrightarrow	–

S: $N \oplus V$, For signed tests.

V: 0
Cleared

N: R7
Set if MSB of the result is set; cleared otherwise.

Z: $\overline{R7} \bullet \overline{R6} \bullet \overline{R5} \bullet \overline{R4} \bullet \overline{R3} \bullet \overline{R2} \bullet \overline{R1} \bullet \overline{R0}$
Set if the result is \$00; cleared otherwise.

R (Result) equals Rd after the operation.

Example:

```
and r2,r3 ; Bitwise and r2 and r3, result in r2
ldi r16,1 ; Set bitmask 0000 0001 in r16
and r2,r16 ; Isolate bit 0 in r2

ANDI – Logical AND with Immediate

Description:

Performs the logical AND between the contents of register Rd and a constant and places the result in the destination register Rd.

Operation:

$$(i) \quad Rd \leftarrow Rd \bullet K$$

Syntax:

(i) ANDI Rd,K

Operands:

$16 \leq d \leq 31, 0 \leq K \leq 255$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

0111	KKKK	dddd	KKKK
------	------	------	------

Status Register (SREG) and Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	–	\Leftrightarrow	0	\Leftrightarrow	\Leftrightarrow	–

S: $N \oplus V$, For signed tests.

V: 0
Cleared

N: R7
Set if MSB of the result is set; cleared otherwise.

Z: $\overline{R7} \bullet \overline{R6} \bullet \overline{R5} \bullet \overline{R4} \bullet \overline{R3} \bullet \overline{R2} \bullet \overline{R1} \bullet \overline{R0}$
Set if the result is \$00; cleared otherwise.

R (Result) equals Rd after the operation.

Example:

```
andi r17,$0F ; Clear upper nibble of r17
andi r18,$10 ; Isolate bit 4 in r18
andi r19,$AA ; Clear odd bits of r19
```

ASR – Arithmetic Shift Right

Description:

Shifts all bits in Rd one place to the right. Bit 7 is held constant. Bit 0 is loaded into the C Flag of the SREG. This operation effectively divides a signed value by two without changing its sign. The Carry Flag can be used to round the result.

Operation:

(i)

Syntax:

(i) ASR Rd

Operands:

$0 \leq d \leq 31$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

1001	010d	dddd	0101
------	------	------	------

Status Register (SREG) and Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	–	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow

S: $N \oplus V$, For signed tests.

V: $N \oplus C$ (For N and C after the shift)

N: R7
Set if MSB of the result is set; cleared otherwise.

Z: $\overline{R7} \bullet \overline{R6} \bullet \overline{R5} \bullet \overline{R4} \bullet \overline{R3} \bullet \overline{R2} \bullet \overline{R1} \bullet \overline{R0}$
Set if the result is \$00; cleared otherwise.

C: Rd0
Set if, before the shift, the LSB of Rd was set; cleared otherwise.

R (Result) equals Rd after the operation.

Example:

```
ldi r16,$10 ; Load decimal 16 into r16
asr r16      ; r16=r16 / 2
ldi r17,$FC ; Load -4 in r17

BRBC – Branch if Bit in SREG is Cleared

Description:

Conditional relative branch. Tests a single bit in SREG and branches relatively to PC if the bit is cleared. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). The parameter k is the offset from PC and is represented in two's complement form.

Operation:

- (i) If $SREG(s) = 0$ then $PC \leftarrow PC + k + 1$, else $PC \leftarrow PC + 1$

Syntax:

- (i) BRBC s, k

Operands:

$0 \leq s \leq 7, -64 \leq k \leq +63$

Program Counter:

$PC \leftarrow PC + k + 1$
 $PC \leftarrow PC + 1$, if condition is false

16-bit Opcode:

BRCC – Branch if Carry Cleared

Description:

Conditional relative branch. Tests the Carry Flag (C) and branches relatively to PC if C is cleared. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). The parameter k is the offset from PC and is represented in two's complement form. (Equivalent to instruction BRBC 0,k).

Operation:

- (i) If $C = 0$ then $PC \leftarrow PC + k + 1$, else $PC \leftarrow PC + 1$

Syntax:

- (i) BRCC k

Operands:

$-64 \leq k \leq +63$

Program Counter:

BREAK – Break

Description:

The BREAK instruction is used by the On-chip Debug system, and is normally not used in the application software. When the BREAK instruction is executed, the AVR CPU is set in the Stopped Mode. This gives the On-chip Debugger access to internal resources.

If any Lock bits are set, or either the JTAGEN or OCDEN Fuses are unprogrammed, the CPU will treat the BREAK instruction as a NOP and will not enter the Stopped mode.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:

- (i) On-chip Debug system break.

Syntax:

- (i) BREAK

Operands:

BREQ – Branch if Equal

Description:

Conditional relative branch. Tests the Zero Flag (Z) and branches relatively to PC if Z is set. If the instruction is executed immediately after any of the instructions CP, CPI, SUB or SUBI, the branch will occur if and only if the unsigned or signed binary number represented in Rd was equal to the unsigned or signed binary number represented in Rr. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). The parameter k is the offset from PC and is represented in two's complement form. (Equivalent to instruction BRBS 1,k).

Operation:

BRGE – Branch if Greater or Equal (Signed)

Description:

Conditional relative branch. Tests the Signed Flag (S) and branches relatively to PC if S is cleared. If the instruction is executed immediately after any of the instructions CP, CPI, SUB or SUBI, the branch will occur if and only if the signed binary number represented in Rd was greater than or equal to the signed binary number represented in Rr. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). The parameter k is the offset from PC and is represented in two's complement form. (Equivalent to instruction BRBC 4,k).

Operation:

BRMI – Branch if Minus

Description:

Conditional relative branch. Tests the Negative Flag (N) and branches relatively to PC if N is set. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). The parameter k is the offset from PC and is represented in two's complement form. (Equivalent to instruction BRBS 2,k).

Operation:

- (i) If $N = 1$ then $PC \leftarrow PC + k + 1$, else $PC \leftarrow PC + 1$

Syntax:

- (i) BRMI k

Operands:

$-64 \leq k \leq +63$

Program Counter:

$PC \leftarrow PC + k + 1$

$PC \leftarrow PC + 1$, if condition is false

16-bit Opcode:

BRNE – Branch if Not Equal

Description:

Conditional relative branch. Tests the Zero Flag (Z) and branches relatively to PC if Z is cleared. If the instruction is executed immediately after any of the instructions CP, CPI, SUB or SUBI, the branch will occur if and only if the unsigned or signed binary number represented in Rd was not equal to the unsigned or signed binary number represented in Rr. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). The parameter k is the offset from PC and is represented in two's complement form. (Equivalent to instruction BRBC 1,k).

Operation:

- (i) If $Rd \neq Rr$ ($Z = 0$) then $PC \leftarrow PC + k + 1$, else $PC \leftarrow PC + 1$

Syntax:

- (i) BRNE k

Operands:

$-64 \leq k \leq +63$

Program Counter:

BRPL – Branch if Plus

Description:

Conditional relative branch. Tests the Negative Flag (N) and branches relatively to PC if N is cleared. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). The parameter k is the offset from PC and is represented in two's complement form. (Equivalent to instruction BRBC 2,k).

Operation:

- (i) If $N = 0$ then $PC \leftarrow PC + k + 1$, else $PC \leftarrow PC + 1$

Syntax:

- (i) BRPL k

Operands:

$-64 \leq k \leq +63$

Program Counter:

BRSR – Branch if Same or Higher (Unsigned)

Description:

Conditional relative branch. Tests the Carry Flag (C) and branches relatively to PC if C is cleared. If the instruction is executed immediately after execution of any of the instructions CP, CPI, SUB or SUBI the branch will occur if and only if the unsigned binary number represented in Rd was greater than or equal to the unsigned binary number represented in Rr. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). The parameter k is the offset from PC and is represented in two's complement form. (Equivalent to instruction BRBC 0,k).

Operation:

- (i) If $Rd \geq Rr$ ($C = 0$) then $PC \leftarrow PC + k + 1$, else $PC \leftarrow PC + 1$

Syntax:

- (i) BRSR k

Operands:

$-64 \leq k \leq +63$

Program Counter:

BRTC – Branch if the T Flag is Cleared

Description:

Conditional relative branch. Tests the T Flag and branches relatively to PC if T is cleared. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). The parameter k is the offset from PC and is represented in two's complement form. (Equivalent to instruction BRBC 6,k).

Operation:

- (i) If $T = 0$ then $PC \leftarrow PC + k + 1$, else $PC \leftarrow PC + 1$

Syntax:

- (i) BRTC k

Operands:

$-64 \leq k \leq +63$

Program Counter:

$PC \leftarrow PC + k + 1$

$PC \leftarrow PC + 1$, if condition is false

16-bit Opcode:

BSET – Bit Set in SREG

Description:

Sets a single Flag or bit in SREG.

Operation:

(i) $SREG(s) \leftarrow 1$

Syntax:

(i) BSET s

Operands:

$0 \leq s \leq 7$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

BST – Bit Store from Bit in Register to T Flag in SREG

Description:

Stores bit b from Rd to the T Flag in SREG (Status Register).

Operation:

(i) $T \leftarrow Rd(b)$

Syntax:

(i) BST Rd,b

Operands:

$0 \leq d \leq 31, 0 \leq b \leq 7$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

CALL – Long Call to a Subroutine

Description:

Calls to a subroutine within the entire Program memory. The return address (to the instruction after the CALL) will be stored onto the Stack. (See also RCALL). The Stack Pointer uses a post-decrement scheme during CALL.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:

- (i) $PC \leftarrow k$ Devices with 16 bits PC, 128K bytes Program memory maximum.
- (ii) $PC \leftarrow k$ Devices with 22 bits PC, 8M bytes Program memory maximum.

Syntax:

- (i) CALL k

Operands:

$0 \leq k < 64K$

Program Counter

$PC \leftarrow k$

Stack:

$STACK \leftarrow PC+2$
 $SP \leftarrow SP-2$, (2 bytes, 16 bits)

- (ii) CALL k

$0 \leq k < 4M$

$PC \leftarrow k$

$STACK \leftarrow PC+2$
 $SP \leftarrow SP-3$ (3 bytes, 22 bits)

32-bit Opcode:

CBI – Clear Bit in I/O Register

Description:

Clears a specified bit in an I/O Register. This instruction operates on the lower 32 I/O Registers – addresses 0-31.

Operation:

(i) $I/O(A,b) \leftarrow 0$

Syntax:

(i) CBI A,b

Operands:

$0 \leq A \leq 31, 0 \leq b \leq 7$

Program Counter:

CBR – Clear Bits in Register

Description:

Clears the specified bits in register Rd. Performs the logical AND between the contents of register Rd and the complement of the constant mask K. The result will be placed in register Rd.

Operation:

(i) $Rd \leftarrow Rd \bullet (\$FF - K)$

Syntax:

(i) CBR Rd,K

Operands:

$16 \leq d \leq 31, 0 \leq K \leq 255$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode: (see ANDI with K complemented)

Status Register (SREG) and Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	–	\Leftrightarrow	0	\Leftrightarrow	\Leftrightarrow	–

S: $N \oplus V$, For signed tests.

V: 0

DEC – Decrement

Description:

Subtracts one -1- from the contents of register Rd and places the result in the destination register Rd.

The C Flag in SREG is not affected by the operation, thus allowing the DEC instruction to be used on a loop counter in multiple-precision computations.

When operating on unsigned values, only BREQ and BRNE branches can be expected to perform consistently. When operating on two's complement values, all signed branches are available.

Operation:

(i) $Rd \leftarrow Rd - 1$

Syntax:

DES – Data Encryption Standard

Description:

The module is an instruction set extension to the AVR CPU, performing DES iterations. The 64-bit data block (plaintext or ciphertext) is placed in the CPU register file, registers R0-R7, where LSB of data is placed in LSB of R0 and MSB of data is placed in MSB of R7. The full 64-bit key (including parity bits) is placed in registers R8-R15, organized in the register file with LSB of key in LSB of R8 and MSB of key in MSB of R15. Executing one DES instruction performs one round in the DES algorithm. Sixteen rounds must be executed in increasing order to form the correct DES ciphertext or plaintext. Intermediate results are stored in the register file (R0-R15) after each DES instruction. The instruction's operand (K) determines which round is executed, and the half carry flag (H) determines whether encryption or decryption is performed.

The DES algorithm is described in "Specifications for the Data Encryption Standard" (Federal Information Processing Standards Publication 46). Intermediate results in this implementation differ from the standard because the initial permutation and the inverse initial permutation are performed each iteration. This does not affect the result in the final ciphertext or plaintext, but reduces execution time.

Operation:

- (i) If H = 0 then Encrypt round (R7-R0, R15-R8, K)
 If H = 1 then Decrypt round (R7-R0, R15-R8, K)

ELPM – Extended Load Program Memory

Description:

Loads one byte pointed to by the Z-register and the RAMPZ Register in the I/O space, and places this byte in the destination register Rd. This instruction features a 100% space effective constant initialization or constant data fetch. The Program memory is organized in 16-bit words while the Z-pointer is a byte address. Thus, the least significant bit of the Z-pointer selects either low byte ($Z_{LSB} = 0$) or high byte ($Z_{LSB} = 1$). This instruction can address the entire Program memory space. The Z-pointer Register can either be left unchanged by the operation, or it can be incremented. The incrementation applies to the entire 24-bit concatenation of the RAMPZ and Z-pointer Registers.

Devices with Self-Programming capability can use the ELPM instruction to read the Fuse and Lock bit value. Refer to the device documentation for a detailed description.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

The result of these combinations is undefined:

ELPM r30, Z+
ELPM r31, Z+

Operation:

- (i) $R0 \leftarrow (RAMPZ:Z)$

FMUL – Fractional Multiply Unsigned

Description:

This instruction performs 8-bit \times 8-bit \rightarrow 16-bit unsigned multiplication and shifts the result one bit left.

Let (N.Q) denote a fractional number with N binary digits left of the radix point, and Q binary digits right of the radix point. A multiplication between two numbers in the formats (N1.Q1) and (N2.Q2) results in the format ((N1+N2).(Q1+Q2)). For signal processing applications, the format (1.7) is widely used for the inputs, resulting in a (2.14) format for the product. A left shift is required for the high byte of the product to be in the same format as the inputs. The FMUL instruction incorporates the shift operation in the same number of cycles as MUL.

The (1.7) format is most commonly used with signed numbers, while FMUL performs an unsigned multiplication. This instruction is therefore most useful for calculating one of the partial products when performing a signed multiplication with 16-bit inputs in the (1.15) format, yielding a result in the (1.31) format. Note: the result of the FMUL operation may suffer from a 2's complement overflow if interpreted as a number in the (1.15) format. The MSB of the multiplication before shifting must be taken into account, and is found in the carry bit. See the following example.

The multiplicand Rd and the multiplier Rr are two registers containing unsigned fractional numbers where the implicit radix point lies between bit 6 and bit 7. The 16-bit unsigned fractional product with the implicit radix point between bit 14 and bit 15 is placed in R1 (high byte) and R0 (low byte).

This instruction is not available in all devices. Refer to the device specific instruction set summary.

FMULS – Fractional Multiply Signed

Description:

This instruction performs 8-bit \times 8-bit \rightarrow 16-bit signed multiplication and shifts the result one bit left.

Let (N.Q) denote a fractional number with N binary digits left of the radix point, and Q binary digits right of the radix point. A multiplication between two numbers in the formats (N1.Q1) and (N2.Q2) results in the format ((N1+N2).(Q1+Q2)). For signal processing applications, the format (1.7) is widely used for the inputs, resulting in a (2.14) format for the product. A left shift is required for the high byte of the product to be in the same format as the inputs. The FMULS instruction incorporates the shift operation in the same number of cycles as MULS.

The multiplicand Rd and the multiplier Rr are two registers containing signed fractional numbers where the implicit radix point lies between bit 6 and bit 7. The 16-bit signed fractional product with the implicit radix point between bit 14 and bit 15 is placed in R1 (high byte) and R0 (low byte).

Note that when multiplying 0x80 (-1) with 0x80 (-1), the result of the shift operation is 0x8000 (-1). The shift operation thus gives a two's complement overflow. This must be checked and handled by software.

FMULSU – Fractional Multiply Signed with Unsigned

Description:

This instruction performs 8-bit \times 8-bit \rightarrow 16-bit signed multiplication and shifts the result one bit left.

Let (N.Q) denote a fractional number with N binary digits left of the radix point, and Q binary digits right of the radix point. A multiplication between two numbers in the formats (N1.Q1) and (N2.Q2) results in the format ((N1+N2).(Q1+Q2)). For signal processing applications, the format (1.7) is widely used for the inputs, resulting in a (2.14) format for the product. A left shift is required for the high byte of the product to be in the same format as the inputs. The FMULSU instruction incorporates the shift operation in the same number of cycles as MULSU.

The (1.7) format is most commonly used with signed numbers, while FMULSU performs a multiplication with one unsigned and one signed input. This instruction is therefore most useful for calculating two of the partial products when performing a signed multiplication with 16-bit inputs in the (1.15) format, yielding a result in the (1.31) format. Note: the result of the FMULSU operation may suffer from a 2's complement overflow if interpreted as a number in the (1.15) format. The MSB of the multiplication before shifting must be taken into account, and is found in the carry bit. See the following example.

The multiplicand Rd and the multiplier Rr are two registers containing fractional numbers where the implicit radix point lies between bit 6 and bit 7. ICALL – Indirect Call to Subroutine

Description:

Calls to a subroutine within the entire 4M (words) Program memory. The return address (to the instruction after the CALL) will be stored onto the Stack. See also RCALL. The Stack Pointer uses a post-decrement scheme during CALL.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:

- (i) $PC(15:0) \leftarrow Z(15:0)$ Devices with 16 bits PC, 128K bytes Program memory maximum.
- (ii) $PC(15:0) \leftarrow Z(15:0)$ Devices with 22 bits PC, 8M bytes Program memory maximum.
 $PC(21:16) \leftarrow 0$

	Syntax:	Operands:	Program Counter:	Stack:
(i)	ICALL	None	See Operation	$STACK \leftarrow PC + 1$ $SP \leftarrow SP - 2$ (2 bytes, 16 bits)
(ii)	ICALL	None	See Operation	$STACK \leftarrow PC + 1$ $SP \leftarrow SP - 3$ (3 bytes, 22 bits)

IJMP – Indirect Jump

Description:

Indirect jump to the address pointed to by the Z (16 bits) Pointer Register in the Register File. The Z-pointer Register is 16 bits wide and allows jump within the lowest 64K words (128K bytes) section of Program memory.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:

- (i) $PC \leftarrow Z(15:0)$ Devices with 16 bits PC, 128K bytes Program memory maximum.
- (ii) $PC(15:0) \leftarrow Z(15:0)$ Devices with 22 bits PC, 8M bytes Program memory maximum.

INC – Increment

Description:

Adds one -1- to the contents of register Rd and places the result in the destination register Rd.

The C Flag in SREG is not affected by the operation, thus allowing the INC instruction to be used on a loop counter in multiple-precision computations.

When operating on unsigned numbers, only BREQ and BRNE branches can be expected to perform consistently. When operating on two's complement values, all signed branches are available.

Operation:

(i) $Rd \leftarrow Rd + 1$

Syntax:

(i) INC Rd

Operands:

$0 \leq d \leq 31$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

Status Register and Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	–	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow	–

S: $N \oplus V$
For signed tests.

V: $R7 \bullet \overline{R6} \bullet \overline{R5} \bullet \overline{R4} \bullet \overline{R3} \bullet R2 \bullet \overline{R1} \bullet \overline{R0}$
Set if two's complement overflow resulted from the operation; cleared otherwise. Two's complement overflow occurs if and only if Rd was \$7F before the operation.

N: R7
Set if MSB of the result is set; cleared otherwise.

Z: $\overline{R7} \bullet \overline{R6} \bullet \overline{R5} \bullet \overline{R4} \bullet \overline{R3} \bullet \overline{R2} \bullet \overline{R1} \bullet \overline{R0}$
Set if the result is \$00; Cleared otherwise.

R (Result) equals Rd after the operation.

Example:

```

LD – Load Indirect from Data Space to Register using Index X

Description:

Loads one byte indirect from the data space to a register. For parts with SRAM, the data space consists of the Register File, I/O memory and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. In some parts the Flash Memory has been mapped to the data space and can be read using this command. The EEPROM has a separate address space.

The data location is pointed to by the X (16 bits) Pointer Register in the Register File. Memory access is limited to the current data segment of 64K bytes. To access another data segment in devices with more than 64K bytes data space, the RAMPX in register in the I/O area has to be changed.

The X-pointer Register can either be left unchanged by the operation, or it can be post-incremented or pre-decremented. These features are especially suited for accessing arrays, tables, and Stack Pointer usage of the X-pointer Register. Note that only the low byte of the X-pointer is updated in devices with no more than 256 bytes data space. For such devices, the high byte of the pointer is not used by this instruction and can be used for other purposes. The RAMPX Register in the I/O area is updated in parts with more than 64K bytes data space or more than 64K bytes Program memory, and the increment/decrement is added to the entire 24-bit address on such devices.

Not all variants of this instruction is available in all devices. Refer to the device specific instruction set summary.

In the ATtiny10 the LD instruction can be used to achieve the same operation as LPM since the program memory is mapped to the data memory space.

The result of these combinations is undefined:

```
LD r26, X+
LD r27, X+
LD r26, -X
LD r27, -X
```

Using the X-pointer:

Operation:		Comment:

LD (LDD) – Load Indirect From Data Space to Register using Index Z

Description:

Loads one byte indirect with or without displacement from the data space to a register. For parts with SRAM, the data space consists of the Register File, I/O memory and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. In some parts the Flash Memory has been mapped to the data space and can be read using this command. The EEPROM has a separate address space.

The data location is pointed to by the Z (16 bits) Pointer Register in the Register File. Memory access is limited to the current data segment of 64K bytes. To access another data segment in devices with more than 64K bytes data space, the RAMPZ in register in the I/O area has to be changed.

The Z-pointer Register can either be left unchanged by the operation, or it can be post-incremented or pre-decremented. These features are especially suited for Stack Pointer usage of the Z-pointer Register, however because the Z-pointer Register can be used for indirect subroutine calls, indirect jumps and table lookup, it is often more convenient to use the X or Y-pointer as a dedicated Stack Pointer. Note that only the low byte of the Z-pointer is updated in devices with no more than 256 bytes data space. For such devices, the high byte of the pointer is not used by this instruction and can be used for other purposes. The RAMPZ Register in the I/O area is updated in parts with more than 64K bytes data space or more than 64K bytes Program memory, and the increment/decrement/displacement is added to the entire 24-bit address on such devices.

LPM – Load Program Memory

Description:

Loads one byte pointed to by the Z-register into the destination register Rd. This instruction features a 100% space effective constant initialization or constant data fetch. The Program memory is organized in 16-bit words while the Z-pointer is a byte address. Thus, the least significant bit of the Z-pointer selects either low byte ($Z_{LSB} = 0$) or high byte ($Z_{LSB} = 1$). This instruction can address the first 64K bytes (32K words) of Program memory. The Z-pointer Register can either be left unchanged by the operation, or it can be incremented. The incrementation does not apply to the RAMPZ Register.

Devices with Self-Programming capability can use the LPM instruction to read the Fuse and Lock bit values. Refer to the device documentation for a detailed description.

The LPM instruction is not available in all devices. Refer to the device specific instruction set summary.

The result of these combinations is undefined:

LPM r30, Z+
LPM r31, Z+

Operation:

- (i) $R0 \leftarrow (Z)$
- (ii) $Rd \leftarrow (Z)$
- (iii) $Rd \leftarrow (Z)$ $Z \leftarrow Z + 1$

Comment:

Z: Unchanged, R0 implied destination register
Z: Unchanged
Z: Post incremented

Syntax:

- (i) LPM
- (ii) LPM Rd, Z
- (iii) LPM Rd, Z+

Operands:

LSR – Logical Shift Right

Description:

Shifts all bits in Rd one place to the right. Bit 7 is cleared. Bit 0 is loaded into the C Flag of the SREG. This operation effectively divides an unsigned value by two. The C Flag can be used to round the result.

Operation:

Syntax: LSR Rd
Operands: $0 \leq d \leq 31$
Program Counter: $PC \leftarrow PC + 1$

16-bit Opcode:

MUL – Multiply Unsigned

Description:

This instruction performs 8-bit \times 8-bit \rightarrow 16-bit unsigned multiplication.

The multiplicand Rd and the multiplier Rr are two registers containing unsigned numbers. The 16-bit unsigned product is placed in R1 (high byte) and R0 (low byte). Note that if the multiplicand or the multiplier is selected from R0 or R1 the result will overwrite those after multiplication.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:

- (i) $R1:R0 \leftarrow Rd \times Rr$ (unsigned \leftarrow unsigned \times unsigned)

Syntax:

RETI – Return from Interrupt

Description:

Returns from interrupt. The return address is loaded from the STACK and the Global Interrupt Flag is set.

Note that the Status Register is not automatically stored when entering an interrupt routine, and it is not restored when returning from an interrupt routine. This must be handled by the application program. The Stack Pointer uses a pre-increment scheme during RETI.

Operation:

- (i) $PC(15:0) \leftarrow STACK$ Devices with 16 bits PC, 128K bytes Program memory maximum.
- (ii) $PC(21:0) \leftarrow STACK$ Devices with 22 bits PC, 8M bytes Program memory maximum.

	Syntax:	Operands:	Program Counter:	Stack
(i)	RETI	None	See Operation	$SP \leftarrow SP + 2$ (2 bytes, 16 bits)
(ii)	RETI	None	See Operation	$SP \leftarrow SP + 3$ (3 bytes, 22 bits)

16-bit Opcode:

------	------	------	------

Status Register (SREG) and Boolean Formula:

I	T	H	S	V	N	Z	C
1	–	–	–	–	–	–	–

I: 1
The I Flag is set.

Example:

```

...
extint:  push    r0        ; Save r0 on the Stack

RJMP – Relative Jump

Description:

Relative jump to an address within $PC - 2K + 1$ and $PC + 2K$ (words). For AVR microcontrollers with Program memory not exceeding 4K words (8K bytes) this instruction can address the entire memory from every address location. See also JMP.

Operation:

(i) $PC \leftarrow PC + k + 1$

Syntax:

ROL – Rotate Left through Carry

Description:

Shifts all bits in Rd one place to the left. The C Flag is shifted into bit 0 of Rd. Bit 7 is shifted into the C Flag. This operation, combined with LSL, effectively multiplies multi-byte signed and unsigned values by two.

Operation:

Syntax: ROL Rd
Operands: $0 \leq d \leq 31$
Program Counter: $PC \leftarrow PC + 1$

16-bit Opcode: (see ADC Rd,Rd)

0001	11dd	dddd	dddd
------	------	------	------

Status Register (SREG) and Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	↔	↔	↔	↔	↔	↔

H: Rd3

S: $N \oplus V$, For signed tests.

V: $N \oplus C$ (For N and C after the shift)

N: R7
Set if MSB of the result is set; cleared otherwise.

Z: $\overline{R7} \bullet \overline{R6} \bullet \overline{R5} \bullet \overline{R4} \bullet \overline{R3} \bullet \overline{R2} \bullet \overline{R1} \bullet \overline{R0}$
Set if the result is \$00; cleared otherwise.

C: Rd7
Set if, before the shift, the MSB of Rd was set; cleared otherwise.

R (Result) equals Rd after the operation.

Example:

```
lsl  r18      ; Multiply r19:r18 by two

ROR – Rotate Right through Carry

Description:

Shifts all bits in Rd one place to the right. The C Flag is shifted into bit 7 of Rd. Bit 0 is shifted into the C Flag. This operation, combined with ASR, effectively divides multi-byte signed values by two. Combined with LSR it effectively divides multi-byte unsigned values by two. The Carry Flag can be used to round the result.

Operation:

Syntax: ROR Rd
Operands: $0 \leq d \leq 31$
Program Counter: $PC \leftarrow PC + 1$

16-bit Opcode:

1001	010d	dddd	0111
------	------	------	------

Status Register (SREG) and Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	–	↔	↔	↔	↔	↔

S: $N \oplus V$, For signed tests.

V: $N \oplus C$ (For N and C after the shift)

N: R7
 Set if MSB of the result is set; cleared otherwise.

Z: $\overline{R7} \bullet \overline{R6} \bullet \overline{R5} \bullet \overline{R4} \bullet \overline{R3} \bullet \overline{R2} \bullet \overline{R1} \bullet \overline{R0}$
 Set if the result is \$00; cleared otherwise.

C: Rd0
 Set if, before the shift, the LSB of Rd was set; cleared otherwise.

R (Result) equals Rd after the operation.

Example:

```

lsr  r19          ; Divide r19:r18 by two

–	–	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow	\Leftrightarrow

H: $\overline{Rd3} \bullet Rr3 + Rr3 \bullet R3 + R3 \bullet \overline{Rd3}$
Set if there was a borrow from bit 3; cleared otherwise

S: $N \oplus V$, For signed tests.

V: $Rd7 \bullet \overline{Rr7} \bullet \overline{R7} + \overline{Rd7} \bullet Rr7 \bullet R7$
Set if two's complement overflow resulted from the operation; cleared otherwise.

N: R7
Set if MSB of the result is set; cleared otherwise.

Z: $\overline{R7} \bullet \overline{R6} \bullet \overline{R5} \bullet \overline{R4} \bullet \overline{R3} \bullet \overline{R2} \bullet \overline{R1} \bullet \overline{R0} \bullet Z$
Previous value remains unchanged when the result is zero; cleared otherwise.

C: $\overline{Rd7} \bullet Rr7 + Rr7 \bullet R7 + R7 \bullet \overline{Rd7}$
Set if the absolute value of the contents of Rr plus previous carry is larger than the absolute value of the Rd; cleared otherwise.

R (Result) equals Rd after the operation.

Example:

SPM – Store Program Memory

Description:

SPM can be used to erase a page in the Program memory, to write a page in the Program memory (that is already erased), and to set Boot Loader Lock bits. In some devices, the Program memory can be written one word at a time, in other devices an entire page can be programmed simultaneously after first filling a temporary page buffer. In all cases, the Program memory must be erased one page at a time. When erasing the Program memory, the RAMPZ and Z-register are used as page address. When writing the Program memory, the RAMPZ and Z-register are used as page or word address, and the R1:R0 register pair is used as data⁽¹⁾. When setting the Boot Loader Lock bits, the R1:R0 register pair is used as data. Refer to the device documentation for detailed description of SPM usage. This instruction can address the entire Program memory.

The SPM instruction is not available in all devices. Refer to the device specific instruction set summary.

ST – Store Indirect From Register to Data Space using Index X

Description:

Stores one byte indirect from a register to data space. For parts with SRAM, the data space consists of the Register File, I/O memory and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. The EEPROM has a separate address space.

The data location is pointed to by the X (16 bits) Pointer Register in the Register File. Memory access is limited to the current data segment of 64K bytes. To access another data segment in devices with more than 64K bytes data space, the RAMPX in register in the I/O area has to be changed.

The X-pointer Register can either be left unchanged by the operation, or it can be post-incremented or pre-decremented. These features are especially suited for accessing arrays, tables, and Stack Pointer usage of the X-pointer Register. Note that only the low byte of the X-pointer is updated in devices with no more than 256 bytes data space. For such devices, the high byte of the pointer is not used by this instruction and can be used for other purposes. The RAMPX Register in the I/O area is updated in parts with more than 64K bytes data space or more than 64K bytes Program memory, and the increment/ decrement is added to the entire 24-bit address on such devices.

ST (STD) – Store Indirect From Register to Data Space using Index Y

Description:

Stores one byte indirect with or without displacement from a register to data space. For parts with SRAM, the data space consists of the Register File, I/O memory and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. The EEPROM has a separate address space.

The data location is pointed to by the Y (16 bits) Pointer Register in the Register File. Memory access is limited to the current data segment of 64K bytes. To access another data segment in devices with more than 64K bytes data space, the RAMPY in register in the I/O area has to be changed.

The Y-pointer Register can either be left unchanged by the operation, or it can be post-incremented or pre-decremented. These features are especially suited for accessing arrays, tables, and Stack Pointer usage of the Y-pointer Register. Note that only the low byte of the Y-pointer is updated in devices with no more than 256 bytes data space. ST (STD) – Store Indirect From Register to Data Space using Index Z

Description:

Stores one byte indirect with or without displacement from a register to data space. For parts with SRAM, the data space consists of the Register File, I/O memory and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. The EEPROM has a separate address space.

The data location is pointed to by the Z (16 bits) Pointer Register in the Register File. Memory access is limited to the current data segment of 64K bytes. To access another data segment in devices with more than 64K bytes data space, the RAMPZ in register in the I/O area has to be changed.

The Z-pointer Register can either be left unchanged by the operation, or it can be post-incremented or pre-decremented. These features are especially suited for Stack Pointer usage of the Z-pointer Register, however because the Z-pointer Register can be used for indirect subroutine calls, indirect jumps and table lookup, it is often more convenient to use the X or Y-pointer as a dedicated Stack Pointer. Note that only the low byte of the Z-pointer is updated in devices with no more than 256 bytes data space. For such devices, the high byte of the pointer is not used by this instruction and can be used for other purposes. The RAMPZ Register in the I/O area is updated in parts with more than 64K bytes data space or more than 64K bytes Program memory, and the increment/decrement/displacement is added to the entire 24-bit address on such devices.

STS – Store Direct to Data Space

Description:

Stores one byte from a Register to the data space. For parts with SRAM, the data space consists of the Register File, I/O memory and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. The EEPROM has a separate address space.

A 16-bit address must be supplied. Memory access is limited to the current data segment of 64K bytes. The STS instruction uses the RAMPD Register to access memory above 64K bytes. To access another data segment in devices with more than 64K bytes data space, the RAMPD in register in the I/O area has to be changed.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:

STS (16-bit) – Store Direct to Data Space

Description:

Stores one byte from a Register to the data space. For parts with SRAM, the data space consists of the Register File, I/O memory and internal SRAM (and external SRAM if applicable). For parts without SRAM, the data space consists of the Register File only. In some parts the Flash memory has been mapped to the data space and can be written using this command. The EEPROM has a separate address space.

A 7-bit address must be supplied. The address given in the instruction is coded to a data space address as follows:

$$\text{ADDR}[7:0] = (\overline{\text{INST}}[8], \text{INST}[8], \text{INST}[10], \text{INST}[9], \text{INST}[3], \text{INST}[2], \text{INST}[1], \text{INST}[0])$$

Memory access is limited to the address range 0x40...0xbf of the data segment.

This instruction is not available in all devices. Refer to the device specific instruction set summary.

Operation:

(i) $(k) \leftarrow Rr$

Syntax:

SUB – Subtract without Carry

Description:

Subtracts two registers and places the result in the destination register Rd.

Operation:

(i) $Rd \leftarrow Rd - Rr$

Syntax:

(i) SUB Rd,Rr

Operands:

$0 \leq d \leq 31, 0 \leq r \leq 31$

Program Counter:

Swaps high and low nibbles in a register.

Operation:

(i) $R(7:4) \leftarrow R(3:0), R(3:0) \leftarrow R(7:4)$

Syntax:

(i) SWAP Rd

Operands:

$0 \leq d \leq 31$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

1001	010d	dddd	0010
------	------	------	------

Status Register and Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	–	–	–	–	–	–

R (Result) equals Rd after the operation.

Example:

```
inc    r1    ; Increment r1
swap   r1    ; Swap high and low nibble of r1
inc    r1    ; Increment high nibble of r1
swap   r1    ; Swap back
```

TST – Test for Zero or Minus

Description:

Tests if a register is zero or negative. Performs a logical AND between a register and itself. The register will remain unchanged.

Operation:

(i) $Rd \leftarrow Rd \bullet Rd$

Syntax:

(i) TST Rd

Operands:

$0 \leq d \leq 31$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode: (see AND Rd, Rd)

0010	00dd	dddd	dddd
------	------	------	------

Status Register and Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	–	\Leftrightarrow	0	\Leftrightarrow	\Leftrightarrow	–

S: $N \oplus V$, For signed tests.

V: 0
Cleared

N: R7
Set if MSB of the result is set; cleared otherwise.

Z: $\overline{R7} \bullet \overline{R6} \bullet \overline{R5} \bullet \overline{R4} \bullet \overline{R3} \bullet \overline{R2} \bullet \overline{R1} \bullet \overline{R0}$
Set if the result is \$00; cleared otherwise.

R (Result) equals Rd.

Example:

```

tst    r0        ; Test r0
breq   zero      ; Branch if r0=0
...
zero:   nop      ; Branch destination (do nothing)

```

WDR – Watchdog Reset

Description:

This instruction resets the Watchdog Timer. This instruction must be executed within a limited time given by the WD prescaler. See the Watchdog Timer hardware specification.

Operation:

- (i) WD timer restart.

Syntax:

- (i) WDR

Operands:

None

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

1001	0101	1010	1000
------	------	------	------

Status Register and Boolean Formula:

I	T	H	S	V	N	Z	C
–	–	–	–	–	–	–	–

Example:

```
wdr ; Reset watchdog timer
```

Words: 1 (2 bytes)

Datasheet Revision History

Please note that the referring page numbers in this section are referred to this document. The referring revision in this section is referred to the document revision.

Rev.0856H – 04/09

1. Updated “Complete Instruction Set Summary” on page 11:

Updated number of clock cycles column to include ATtiny10.

2. Updated sections for ATtiny10 compatibility:

“CBI – Clear Bit in I/O Register” on page 48

“LD – Load Indirect from Data Space to Register using Index X” on page 84

“LD (LDD) – Load Indirect from Data Space to Register using Index Y” on page 87

“LD (LDD) – Load Indirect From Data Space to Register using Index Z” on page 89

“RCALL – Relative Call to Subroutine” on page 111

“SBI – Set Bit in I/O Register” on page 120

“ST – Store Indirect From Register to Data Space using Index X” on page 141

“ST (STD) – Store Indirect From Register to Data Space using Index Y” on page 143

“ST (STD) – Store Indirect From Register to Data Space using Index Z” on page 145

3. Added sections for ATtiny10 compatibility:

“LDS (16-bit) – Load Direct from Data Space” on page 93

“STS (16-bit) – Store Direct to Data Space” on page 148

Rev.0856G – 07/08

1. Inserted “Datasheet Revision History”
2. Updated “Cycles XMEGA” for ST, by removing (iv).
3. Updated “SPM #2” opcodes.

Rev.0856F – 05/08

1. This revision is based on the AVR Instruction Set 0856E-AVR-11/05

Changes done compared to AVR Instruction Set 0856E-AVR-11/05:

- Updated “Complete Instruction Set Summary” with DES and SPM #2.
- Updated AVR Instruction Set with XMEGA Clock cycles and Instruction Description.
